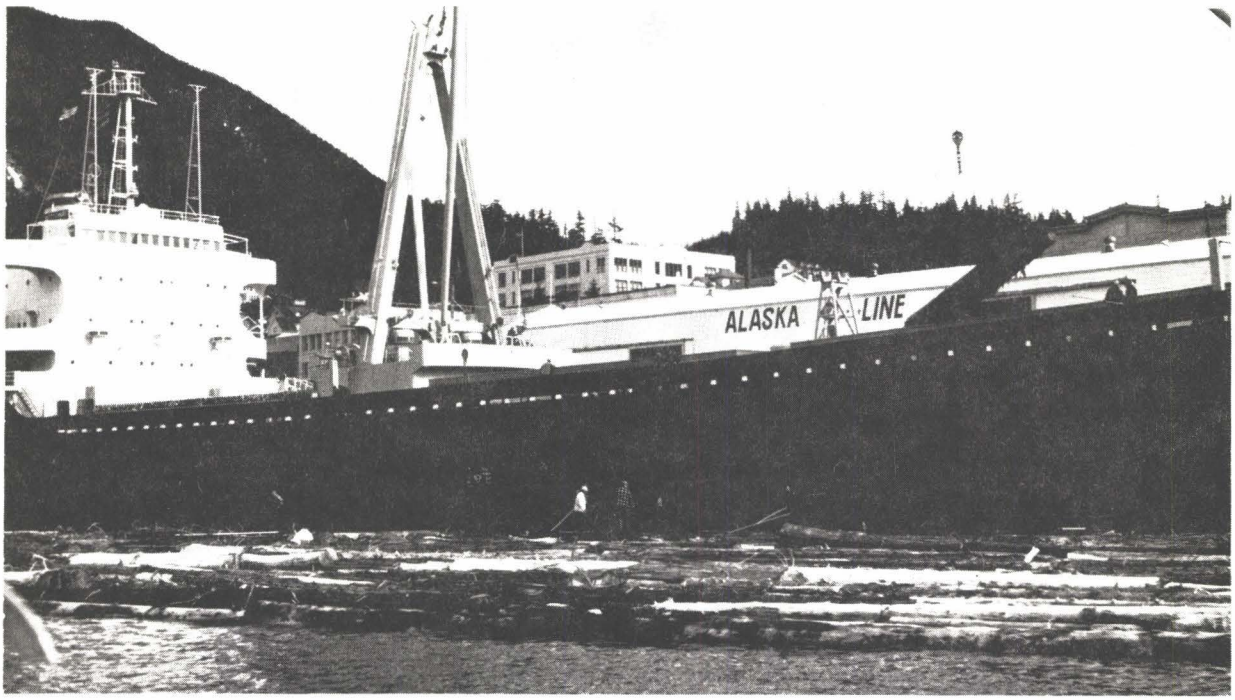
INTRODUCTION

This directory has has been prepared as a part of the Cooperative Forest Management program of the Office of State and Private Forestry, U. S. Forest Service - Alaska Region, U. S. D. A., and the State Forester's Office, Division of Lands, Alaska Department of Natural Resources. This program offers assistance in forest management and in forest products utilization to the forest products industry and to the general public.

In an effort to make this directory as accurate, complete, and up to date as possible, it has been reviewed by a number of interested groups. In addition to the two agencies mentioned above, the following have contributed to its preparation: the Alaska Loggers Association, and the staffs of the National Forests in Alaska.

Any omission or errors are accidental and certainly intend no reflection nor does a listing indicate an endorsement. In that the industry is in a continuous state of change, we have updated the last edition of this booklet, published in May 1972. We would appreciate hearing of errors, omissions, and changes.

If a true picture of the forest products industry in Alaska is desired, a simple listing of all the mills in the State would be misleading. Many of the sawmills in the State are small and operate only sporadically, contributing little to the overall production in Alaska. An effort is continuously being made to weed out those completely unproductive or inoperable mills. Only the mills that have operated recently and have commercial potential have been included. This issue of the directory has been further expanded to give more details regarding the mills. The loggers have merely been listed.



Loading round logs for export

ALASKA FOREST PRODUCTS INDUSTRY

Employment

The annual employment in the forest products industry varies considerably during the year. However, the past several years have shown a steady increase in the average annual figure (State Department of Economic Development):

1970	2,800
1971	2,800
1972	2,800
1973	3,200
1974	2,600

The average hourly wage paid in September 1975 was $9.43. This average is for non-supervisory workers and is based upon earnings and hours worked, or paid for, including overtime pay and hours (State Department of Labor).

Production

Total timber harvested in the State of Alaska for 1974 is estimated to by 657.781 million board feet. It is difficult to estimate how much timber is removed from private lands in Alaska because no records of ownership breakdown are kept. Assuming that most private timber goes to round-log export and using U. S. Customs reports less known export from public lands, it is estimated that 17.473 million board feet was cut from private lands in 1974.

Summary of Alaska Timber Harvested

Seller	Thousand Board Feet Log Scale	
	1973	1974
U. S. Forest Service	663,960	576,810
State of Alaska	38,356	51,241
Bureau of Indian Affairs	25,488	12,083
Bureau of Land Management	2.5	174
Private	21,406	17,473
TOTAL	749,406.5	657,781

End Product Value

The end product value of forest products for the entire State is estimated to be $145.6 million in 1974, up from $137.8 million in 1973 even though the 1974 production was 95 percent of that in 1973 (State Department of Economic Development).

1970	$112,700 million
1971	118.100
1972	109.800
1973	137.800
1974	145.600

Timber harvesting and processing rank third, after oil and fisheries, as the most important industry in Alaska.

Stumpage Rates

Average stumpage paid per MBF from State land:

	1973	1974	1975
Birch	$ 3.14	$ 5.48	$ 5.67
Cottonwood	4.29	10.28	16.12
Hemlock	5.48	14.31	11.00
Sitka spruce	5.16	16.00	12.75
White spruce	19.98	41.02	34.58

Average stumpage paid per MBF for all species:

	1974
U. S. Forest Service	$28.81
State of Alaska	30.02
Bureau of Indian Affairs	50.80
Bureau of Land Management	6.15

Average stumpage price should be viewed with caution, since prices received for individual sales may vary significantly from the averages because of species mix, quality, road costs, logging and processing costs, size and length of sale, number of bidders, and other related price determinants.

Market

The product mix of forest products harvested from National Forest land is approximately 58 percent pulp, 38 percent cants, 2 percent lumber, and 2 percent cedar logs.

The percent of softwood log, cant, lumber, and pulp exported from Alaska are as follows:

	Percent of Total Production Exported	Percent of Total Production Exported to Japan
1970	91.7	98.9
1971	84.2	92.2
1972	85.2	98.2
1973	82.9	99.8
1974	68.9	98.3

Of the 82.9 percent production exported in 1973, 404.8 MMBF were cants, 144.8 MMBF was pulp, and 71.7 MMBF were cedar logs. Exports from Alaska declined by 51.3 percent in 1974 as compared to a reduction of only 18.2 percent in exports from Washington, Oregon, and northern California for the same period.

The volume and average value of softwood log exports from Alaska are as follows:

	Volume (MBF)	Average Value ($/MBF)
1974		
1st Quarter	11,837	253.70
2nd Quarter	12,842	189.94
3rd Quarter	3,836	308.95
4th Quarter	6,434	278.05
TOTAL	34,949	AVERAGE 240.82
1975		
1st Quarter	4,197	638.11

(U. S. Department of Commerce. The valuation definition used in the export statistics is the value at the seaport or border port of exportation. It is based on the selling price (or cost if not sold) and includes inland freight, insurance, and other charges to the port of exportation.)

The volume and value of foreign timber (besides Alaska, also includes the Pacific Northwest and Canada) imported into all Japanese ports during 1974 are as follows (Japan Lumber Journal):

	Logs	Lumber
Sitka spruce	49.123 MMBF $569.17/MBF	83.121 MMBF $647.69/MBF
Western hemlock	982.965 MMBF $445.04/MBF	128.690 MMBF $498.46/MBF
Western red cedar	93.613 MMBF $507.61/MBF	

Future

Alaska's forest products industry is primarily limited to cant mills and pulp mills whose production, as seen in preceding statistics, is exported. The more refined primary processing industry, such as finish sawmills with drying facilities, and the secondary industries (millwork, cabinets, furniture, etc.) are limited within the State. The reason for this limited development is the limited demand of the local Alaskan market. The large forest products industry of the Pacific Northwest has been able to maintain its dominancy in processed products due to their lower unit cost. In like manner the Alaskan industry has not been able to compete in the lower 48.

The world demand for wood fiber will undoubtedly continue to increase. There is every reason to believe that this demand will favorably influence the Alaskan forest products industry. However, the expansion of the industry within Alaska is dependent upon several factors:

1) The land use policies of the state and federal government on existing public land.

2) The decision of who will manage the 80 million acres or so of d-2 or four National Conservation System lands.

3) The resource development decisions of the Native community.

4) Expansion of the transportation network.

5) Exemption of trade restrictions such as regulations requiring third-class carriers to increase their rates and the Jones Act that requires only American built and owned ships may carry products between American ports.

6) Prevalancy of state and federal regulations on the Alaska forest products industry regardless of location, management or ownership.

7) Production of well manufactured products that originate from a reliable source and are put on the market at a competitive price with an adequate margin of profit.

8) The expansion of speciality products and the implementation of recent developments in new processes and products that can compete in the world market.

9) Public's willingness to allow the industry to continue to operate within Alaska.

10) Consumer acceptance and confidence in Alaskan forest products.

SAWMILLS IN ALASKA

Explanation of Listings

All of the listings are arranged alphabetically under the five major geographical regions of Alaska - Southeast; Southcentral; Western; Interior; and Arctic (see map). The industry classifications are loggers, sawmills, consultants, scaling bureaus and other forest industries.

The term "primary" is used to describe that industry which uses or processes wood in its round or rough state, whether on the stump or in the form of a log, bolt or pole. Included in this classification are loggers, sawmills, shake or shingle mills, cant mills and pulpmills.

The term "secondary" is used to describe those industries that remanufacture the products of primary industry. Wholesale and retail yards, millwork concerns and the like are listed herein.

The term "support" industry is used to describe services proved to both primary and secondary industries. These would include consultants, scaling bureaus and technical assistance programs.

Export cants that have undergone federal primary manufacturing requirements.

Native Alaskan hardwood lumber for cabinets.

LOG SCALING

Scaling is the determination of the gross and net volume of logs by the customary commercial units for the product involved; volume may be expressed in terms of board feet, cords, cubic feet, linear feet, or number of pieces. Scaling is not guessing; it is an art founded on applying specific rules in a consistent manner based on experienced judgement as to how serious certain external indicators of defect are in a specific locality.

Increased activity in the industry has generated an interest in third party scaling. Third party scaling is principally an independent agency that represents both the buyer and seller of forest products. These agencies are normally called log scaling and grading bureaus. The Pacific Northwest is represented by five bureaus; but only one bureau is operating within Alaska:

Puget Sound Log Scaling and Grading Bureau
P. O. Box 11343
Tacoma, Washington 98411

Services and charges are typically contract scaling by month or volume, daily rate, hourly rate, utility scaling by volume, water scaling by volume and/or piece rate.

The other four bureaus are:

Southern Oregon Log Scaling & Grading Bureau
948 S.E. Mill Street
Roseburg, Oregon 97470

Northern California Log Scaling & Grading Bureau
1180 8th Street
Arcata, California 95521

Columbia River Log Scaling & Grading Bureau
2260 Oakmont Way
Eugene, Oregon 97401

Grays Harbor Log Scaling & Grading Bureau
504 8th Avenue
Hoquiam, Washington 98550

NATURAL RESOURCES CONSULTANTS

This 1975 listing is published as a service to the public. The State of Alaska and the U. S. Forest Service do not endorse this listing nor do they assume responsibility for the action of individuals or firms listed.

A pamphlet title, "Forestry Consultants" is published by the Society of American Foresters for the information of prospective clients. It currently lists over 300 consultants in 42 states. This pamphlet may be obtained from the Society, 5400 Grosvernor Lane, Bethesda, Maryland 20014, for $1.00.

TECHNICAL ASSISTANCE PROGRAMS

Forest Products Utilization and Marketing Assistance for Woodland Owners, Loggers and Processors

The forest-based industry ranks among the largest in the Nation. Each year, from our 500 million acres of productive forest land flow forest products worth more than 1 billion dollars on the stump. Twenty-five billion dollars goes out to the national economy as wages for workers and income for those engaged in growing, harvesting, fabricating, transporting, and distributing forest products.

State Foresters and the U. S. Forest Service assist woodland owners, loggers and processors in achieving better harvesting practices, more efficient processing, and more profitable marketing.

If you are a woodland owner and interested in a multiple use management plan for your woods or in the sale of products from your land, you will be well advised to seek the aid of a forester. The forester is familiar with the present and future needs of the area's wood-using industries. He also is aware of new developments in utilization and marketing. His advice will aid you in finding a market. A profitable sale often depends upon a careful market analysis and advance planning to meet a specific demand. His advice will aid you in economical harvesting. He can advise you on techniques and suggest innovations to suit your specific job.

If you are a logger, service foresters and utilization and marketing specialists are available to help you plan efficient logging operations. As the science of wood technology advances, new products and uses offer opportunities to harvest and sell materials previously left in the woods. Specialists can help you with bucking and grading. You should plan for the most profitable market before touching the tree. Hasty or ill-advised bucking into logs or bolts may render highly valuable raw material unsuitable for the best paying market.

Savings in operation costs can result from proper choice of equipment for cutting, skidding, loading, and hauling. Within your capital investment limitation, you should consider carefully the increased productivity each item of equipment can contribute.

Ready access to all parts of a logging area is necessary for efficient harvesting. Good road location and design will reduce logging costs, but poor judgment in location and design will increase costs and create delays.

Proper safety training pays big dividends in fewer lost time accidents, smaller hospital bills, and lower insurance rates.

Expansion, improvement, and cost analysis of woods operation depend on accurate records of each phase of an operation. Simple record keeping to show a profit or loss can be invaluable. A simple contract can prevent arguments between you and the owner.

Supervisors and workmen can benefit through training programs conducted by utilization and marketing specialists. Such training can result in greater efficiency, safety consciousness, and economy of operation.

If you are a processor you know that processing requires special skills and knowledge. To compete successfully, you must be efficient and up to date. Success or failure will depend on your business sense, knowledge of market trends, and ability to meet market demands.

Take advantage of short training courses, workshops, and seminars.

The break-even point must always be considered in your planning. It can be determined only through an analysis of production costs as related to the price received for the product sold.

To build and maintain an efficient operation, you should periodically examine alternatives of operations. Even slight changes in methods or equipment sometimes result in a great increase in productivity.

The smooth flow of material through the processing plant depends upon proper lighting and design of machinery and equipment to minimize handling.

Careful maintenance of equipment cuts time lost because of mechanical breakdown.

Production costs and profits depend on the cost of raw material, the time or labor required to convert it to usable products, and the yield of products or product parts obtained. Studies of yield from basic production units can reveal inefficient equipment or methods, or use of the wrong raw material for the job.

Air drying, accelerated air drying, kiln drying -- each has particular usefulness and advantages.

As in any manufacturing enterprise, a loss of quality in production means a loss in profits.

Finding the best market is a continuous chore. Tailoring the product to changing markets is a challenge to ingenuity. The ability to develop a new market or to anticipate a new trend can prove of great benefit. Efficient marketing requires a knowledge of the volume, availability, and type of raw material, and the ability to create from the available material a marketable product at a competitive price with an adequate margin for profit. Carefully planned advertising, effective packaging, and good service are important tools of the trade.

Close cooperation among woodland owners, loggers, wood processors, and those who offer assistance to them can lead to greater efficiency and expanded job opportunity. As timber and other products of the forest are used more completely, the earning potential of the land is increased. Thriving industries based on dependable sources of raw material and well developed markets raise the standard of living in the timber-producing regions of the country. Thus modern utilization and marketing of forest products presents a challenge to us all, because it concerns both people and forests.
